Biberbot,

You are about to undertake an arduous mission. The earth is in danger of being hit by a huge cheeseteroid. It is YOU that should take the responsibility of saving the planet. Your first task is to build your control station by making reference to the manual. It is indeed a challenging job, but for a brave explorer like you, there shall be no problem. After the whole assembly, decode the diagrams to connect the cables in a correct way and receive further instructions from Mission Control. Here is your checklist to follow after the assembly is finished:

1. Is the power bank (with the lightning bolt) connected to the screen and the raspberry pi chip?

2. Is the screen connected to the green computer chip？

3. Is the speaker connected to the raspberry pi chip and glowing green?

If you have finished these 3 steps, please wait for further instructions from Mission Control. We hope that you are good at crafting electronics. If not, you will learn through trials and errors. This is the only shortcut to succeed.

Aha, almost forget to remind you. Don't worry should some tricky problems crop up. There would always be a lion in the way when you are completing an important mission. Recheck the building instruction, and try to find the sticking points. If you are sure that everything goes smoothly, but the control station still does not work. It is possible that the secret control station kit we sent you was been attacked by aliens while in intergalactic transport before it came to you. If that is the case, immediately send me an encrypted mail to help you find the trouble. I will dispatch you the needed parts in a safer way.

Good luck, Biberbot!
